### **REASON FOR ALLOWANCE**

1. Stettler discloses a wheel assembly comprising a roller body made of plastic with a running ring, an electrically conductive inlay which is constructed as a wire mesh having recesses attached to the disc-shaped wire mesh. Recesses are provided inside the disc-shaped wire mesh which includes web members which are connected to a circular disc which is adapted to slide onto a bushing in the wheel assembly for conducting electrostatic charges away from the wheel. Fletcher discloses a wheel assembly comprising a stiffening plate which adapted to fit onto an axle bushing for strengthening the wheel, a tire which is and a web section which is integrally molded. Black discloses a wheel assembly comprising an elastic liner molded on the inside of the wheel constituting outer shell in which a bearing assembly is housed, a thick and elastic liner molded near the outside of the wheel. Pascal discloses a wheel assembly comprising a molded web or molded sides, a thread, a hub, a bearing assembly fitted between the hub. However, none of the references of record suggests a wheel assembly wherein a hollow sleeve of synthetic resin material impregnated with electrically conductive material is operatively electrically coupled to a peripheral surface of said electrically conductive outer shell, whereby said hollow sleeve having at least one radially stem outwardly extending stem integral therewith in the manner defined in the instant claim 1 and in combination with other limitations of the claim. Therefore, claims 2-9, depending therefrom, are considered to be allowable.
